SKILLS

JavaScript, React, Redux, PostgreSQL, Docker, Git, HTML5, jQuery, Test Driven Development (TDD), Prometheus, Grafana, WebSockets

EDUCATION

BA Computer Science - *Rutgers University - New Brunswick | May 2019*

EXPERIENCE

BGC Partners, Feb 2022 - Present

Software Engineer – Credit Match & Quick History

Mar 2026 - Present

- Owned and delivered the complete modernization of the Quick History platform, rewriting a legacy Java application into JavaScript, changed the application's data source from Market Data to Credit Match databases, and successfully deploying the solution to production within four months.
- Reverse-engineered and documented a codebase unmaintained for two years; used AI-assisted development and implemented feature toggles during the rewrite.
- Designed and delivered customer-level SEF DTO access overrides for the GBX Credit & Rates platform, enabling configurable client entitlements while maintaining regulatory trading controls and Brexit compliance requirements.

Assistant Vice President, Software Engineer – Volume Match & Product Builder

Mar 2025 - Feb 2026

- Led Agile sprint planning for the Product Builder platform across multiple time zones, driving feature delivery and cross-team collaboration. Reviewed merge requests and ensured production readiness through automated testing, code reviews, and continuous integration practices.
- Developed and maintained React applications, ensuring accurate static data generation and launching auctions via Java, with rigorous WebSocket message validation to optimize system performance.
- Diagnosed and resolved production issues through log analysis and data-driven root cause investigations, creating detailed Jira documentation and reproducible test cases that accelerated issue resolution and reduced development turnaround time.

Software Engineer – Volume Match & Product Builder

Feb 2022 - Feb 2025

- Developed advanced front-office trading functionality for Interest Rate Options, introducing drag-and-drop spread creation tools that streamlined custom instrument generation and improved trader efficiency.
- Expanded the global adoption of the Volume Match platform by delivering trading solutions for Interest Rate Options, UK Inflation, EU Inflation, and European Government Bonds, driving an 800% increase in market coverage and a 500% growth in the client base.
- Automated deployment and rollback using GitLab CI and Docker, introducing single-click deployments and one-command rollbacks, reducing system complexity by 60% and accelerating release cycles using GitLab CI and Docker.
- Enhanced production monitoring and observability by developing a Prometheus and PostgreSQL-based monitoring platform and integrating Grafana dashboards and alerting, reducing daily operational monitoring effort by one hour and improving issue detection and resolution.

PROJECTS

MasaNote (Rails, React.js, Redux.js, ReactQuill, JavaScript, PostgreSQL, SCSS) github

MasaNote is a single-page note-taking app that features a rich-text-editor, image uploading and autosaving

- Engineered secure authentication and session management using BCrypt password encryption, RESTful APIs, and cryptographically secure token generation with caching, strengthening application security and user access controls.
- Built key user-facing features using React, Redux, HTML, and SCSS, including a customized React-Quill editor with auto-save, Notebook management, and scalable Redux state management.
